

NeuroNourishLLM — Team Setup Guide

What This Is

A shared Groq-powered knowledge base that integrates with Obsidian.

Ingest research papers, Wikipedia topics, and URLs — then chat with the knowledge base using natural language.

Prerequisites

Everyone needs:

- Python 3.10+ — python.org/downloads
- Git — git-scm.com/downloads
- Obsidian — obsidian.md
- A free Groq API key — console.groq.com

Verify your installs:

```
python3 --version  
git --version
```

Step 1 — Clone the Repo

```
git clone https://github.com/cternullo/NeuroNourishLLM.git  
cd NeuroNourishLLM
```

Step 2 — Get Your Groq API Key

1. Go to console.groq.com
2. Sign up (free, no credit card)
3. Go to API Keys → Create new key
4. Copy it — you will need it in the next step

Step 3 — Create Your .env File

Create a file called .env in the project root. Never commit this file.

For your vault path:

- Mac: /Users/yourname/NeuroNourishLLM
- Windows: C:\Users\yourname\NeuroNourishLLM

Step 4 — Open as Obsidian Vault

1. Open Obsidian
2. Click Open folder as vault
3. Navigate to your cloned NeuroNourishLLM folder
4. Click Open
5. Click Trust and enable all plugins if prompted

Step 5 — Install Dependencies

```
pip install -r requirements.txt
```

Step 6 — Test Your Setup

```
python cli.py ingest topic "Apolipoprotein B"
```

If it works, a new markdown note will appear in your Obsidian vault under the wiki/ folder within seconds.

Daily Commands

Ingest a Wikipedia topic

```
python cli.py ingest topic "your topic here"
```

Ingest a URL

```
python cli.py ingest url https://example.com/article
```

Ingest a PDF research paper

```
python cli.py ingest pdf /path/to/paper.pdf
```

Chat with the knowledge base

```
python cli.py chat "your question here"
```

Regenerate the index

```
python cli.py index
```

Team Git Workflow

Before you start working — always pull first:

```
git pull
```

After adding notes or papers — push your changes:

```
git add .  
git commit -m "added paper on LDL and cognitive decline"  
git push
```

Rules:

- Never commit your .env file
 - Always pull before you push
 - Write a clear commit message describing what you added
-

Troubleshooting

command not found: python3

Install Python from python.org/downloads — use the installer for your OS.

ModuleNotFoundError

Run `pip install -r requirements.txt` again.

GROQ_API_KEY not found

Check your `.env` file exists in the project root and contains your key.

Obsidian vault is empty

Make sure `VAULT_PATH` in your `.env` points exactly to the cloned folder.

Run `python cli.py index` to regenerate the note index.
